Background This gene encodes a class III member of the beta tubulin protein family. Beta tubulins are one of two

core protein families (alpha and beta tubulins) that heterodimerize and assemble to form

microtubules. This protein is primarily expressed in neurons and may be involved in neurogenesis and axon guidance and maintenance. Mutations in this gene are the cause of congenital fibrosis of

the extraocular muscles type 3. Alternate splicing results in multiple transcript variants. A pseudogene of this gene is found on chromosome 6. [provided by RefSeq, Oct 2010]
