**Product Name** : Interferon Regulatory Factor 4 (DGR31552) Rabbit mAb**Cat.No.:** db12395**Synonyms** : MUM1; LSIRF; SHEP8; NF-EM5**Application** : WB, IHC-P, IP**Reactivity** : Human**Host species** : Rabbit**Background**

The protein encoded by this gene belongs to the IRF (interferon regulatory factor) family of transcription factors, characterized by a unique tryptophan pentad repeat DNA-binding domain. The IRFs are important in the regulation of interferons in response to infection by virus, and in the regulation of interferon-inducible genes. This family member is lymphocyte specific and negatively regulates Toll-like-receptor (TLR) signaling that is central to the activation of innate and adaptive immune systems. A chromosomal translocation involving this gene and the IgH locus, t(6;14) (p25;q32), may be a cause of multiple myeloma. Alternatively spliced transcript variants have been found for this gene.
