Background The membrane-associated protein encoded by this gene is included in the superfamily of ATP-

binding cassette (ABC) transporters. ABC proteins transport various molecules across extra- and

intra-cellular membranes. ABC genes are divided into seven distinct subfamilies (ABC1,

MDR/TAP, MRP, ALD, OABP, GCN20, White). This protein is a member of the White subfamily.

Alternatively referred to as a breast cancer resistance protein, this protein functions as a xenobiotic

transporter which may play a major role in multi-drug resistance. It likely serves as a cellular defense mechanism in response to mitoxantrone and anthracycline exposure. Significant

expression of this protein has been observed in the placenta, which may suggest a potential role

for this molecule in placenta tissue. Multiple transcript variants encoding different isoforms have

been found for this gene. [provided by RefSeq, Apr 2012]
