Background This gene encodes a multifunctional protein that binds ubiquitin and regulates activation of the

nuclear factor kappa-B (NF-kB) signaling pathway. The protein functions as a scaffolding/adaptor

protein in concert with TNF receptor-associated factor 6 to mediate activation of NF-kB in

response to upstream signals. Alternatively spliced transcript variants encoding either the same or different isoforms have been identified for this gene. Mutations in this gene result in sporadic and

familial Paget disease of bone. [provided by RefSeq, Mar 2009]
