Background	This gene is a tumor suppressor gene that encodes the growth inhibitory protein hamartin. The
	encoded protein interacts with and stabilizes the GTPase activating protein tuberin. This hamartin-
	tuberin complex negatively regulates mammalian target of rapamycin complex 1 (mTORC1)
	signalling which is a major regulator of anabolic cell growth. This protein also functions as a co-
	chaperone for Hsp90 that inhibits its ATPase activity. This protein functions as a facilitator of
	Hsp90-mediated folding of kinase and non-kinase clients, including Tsc2 and thereby preventing
	their ubiquitination and proteasomal degradation. Mutations in this gene have been associated
	with tuberous sclerosis. [provided by RefSeq, Apr 2018]
