Background This gene encodes a pentaspan transmembrane glycoprotein. The protein localizes to membrane

protrusions and is often expressed on adult stem cells, where it is thought to function in maintaining stem cell properties by suppressing differentiation. Mutations in this gene have been shown to result in retinitis pigmentosa and Stargardt disease. Expression of this gene is also associated with several types of cancer. This gene is expressed from at least five alternative promoters that are expressed in a tissue-dependent manner. Multiple transcript variants encoding different

isoforms have been found for this gene. [provided by RefSeq, Mar 2009]
