Background	The protein encoded by this gene is a member of the cyclin-dependent protein family. CDK family members are highly similar to the gene products of Saccha cdc28, and Schizosaccharomyces pombe cdc2, and are known to be importa cycle progression. This protein forms a trimeric complex with cyclin H and MA as a Cdk-activating kinase (CAK). It is an essential component of the transcrip is involved in transcription initiation and DNA repair. This protein is thought to between the regulation of transcription and the cell cycle.
