Background	The protein encoded by this gene is a member of the MAP kinase family. MAP kinases act as an
	integration point for multiple biochemical signals, and are involved in a wide variety of cellular
	processes such as proliferation, differentiation, transcription regulation and development. This
	kinase is activated by various cell stimuli, and targets specific transcription factors, and thus
	mediates immediate-early gene expression in response to cell stimuli. The activation of this kinase
	by tumor-necrosis factor alpha (TNF-alpha) is found to be required for TNF-alpha induced
	apoptosis. This kinase is also involved in UV radiation induced apoptosis, which is thought to be
	related to cytochrom c-mediated cell death pathway. Studies of the mouse counterpart of this gene
	suggested that this kinase play a key role in T cell proliferation, apoptosis and differentiation.
	Several alternatively spliced transcript variants encoding distinct isoforms have been reported.
