**Background** This gene encodes the integrin alpha M chain. Integrins are heterodimeric integral membrane

proteins composed of an alpha chain and a beta chain. This I-domain containing alpha integrin

combines with the beta 2 chain (ITGB2) to form a leukocyte-specific integrin referred to as

macrophage receptor 1 ('Mac-1'), or inactivated-C3b (iC3b) receptor 3 ('CR3'). The alpha M beta 2 integrin is important in the adherence of neutrophils and monocytes to stimulated endothelium, and

also in the phagocytosis of complement coated particles. Multiple transcript variants encoding

different isoforms have been found for this gene. [provided by RefSeq, Mar 2009]
