Background This gene is a member of the GRB2-associated binding protein (GAB) gene family. These proteins

contain pleckstrin homology (PH) domain, and bind SHP2 tyrosine phosphatase and GRB2

adapter protein. They act as adapters for transmitting various signals in response to stimuli through cytokine and growth factor receptors, and T- and B-cell antigen receptors. The protein encoded by this gene is the principal activator of phosphatidylinositol-3 kinase in response to activation of the high affinity IgE receptor. Two alternatively spliced transcripts encoding different isoforms have

been described for this gene. [provided by RefSeq, Nov 2009]
