Background Integrins are heterodimeric proteins made up of alpha and beta subunits. At least 18 alpha and 8

beta subunits have been described in mammals. Integrin family members are membrane receptors

involved in cell adhesion and recognition in a variety of processes including embryogenesis, hemostasis, tissue repair, immune response and metastatic diffusion of tumor cells. This gene

encodes a beta subunit. Multiple alternatively spliced transcript variants which encode different

protein isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
